GuestOS User Story Map

Latest product stories aligned to the command center, onboarding, QR intake, and operations workflow.

Owner / Admin

As an owner/admin, I want to sign in, see launch readiness, configure venues, opening hours, QR points, and team access, so I can get a workspace ready for live guests.

Venue Manager

As a manager, I want to monitor venue requests, assign operational roles, and review performance signals, so I can keep service moving during busy shifts.

Staff / Security

As staff/security, I want guest requests to arrive with location, priority, latest message context, and clear status actions, so I can respond quickly and safely.

Venue Guest

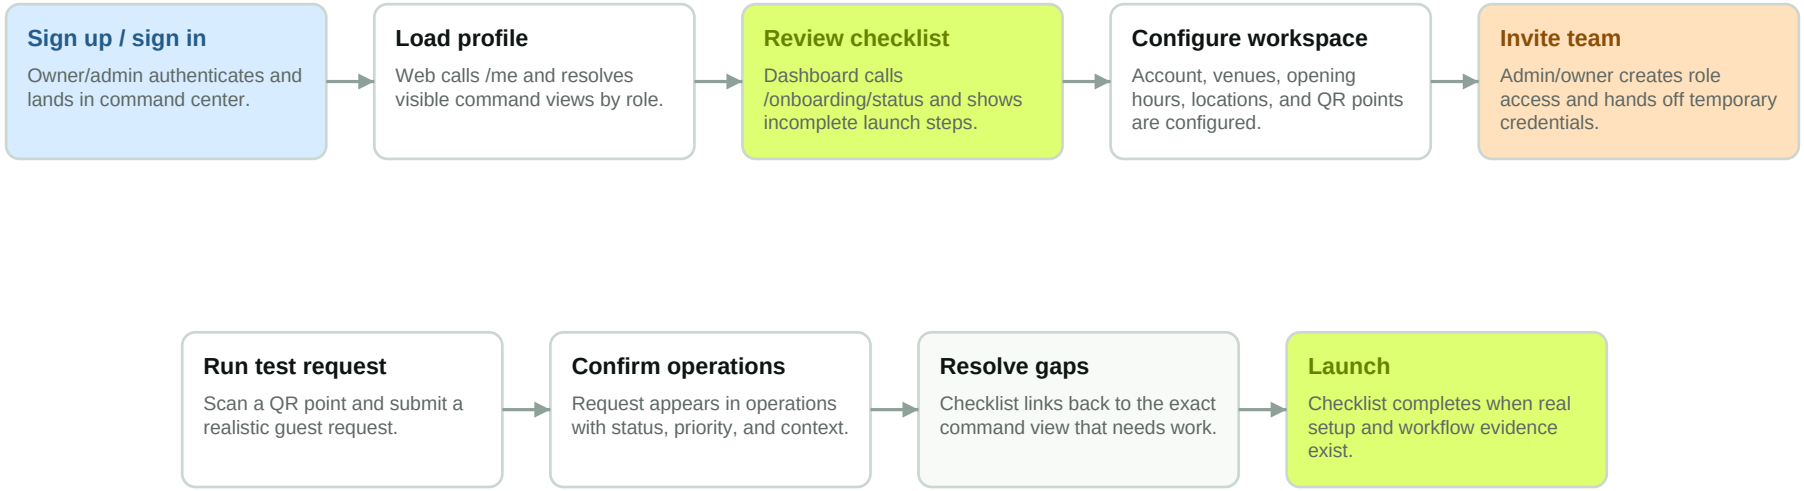
As a guest, I want to scan a QR code, describe what I need, share where I am, and receive updates, so I can get help without finding a staff member.

Current MVP story coverage

Account setup	Supabase auth, /me profile, role-aware command center access, first-login password change.
Launch readiness	Derived onboarding checklist: workspace, venue, opening hours, QR points, team, and test request.
Venue setup	Admin venue list, locations/zones, service-point QR generation, venue-wide guest URLs.
Operations	Venue-scoped request list, filtering, polling/realtime updates, notifications, and status changes.
Guest intake	Public QR/venue chat, guest session persistence, availability checks, follow-up, cancel/rating actions.
Production controls	Rate limits, auth guards, role checks, log redaction, security headers, and Supabase migrations.

Owner/Admin Flow Chart

From account access to production launch readiness.

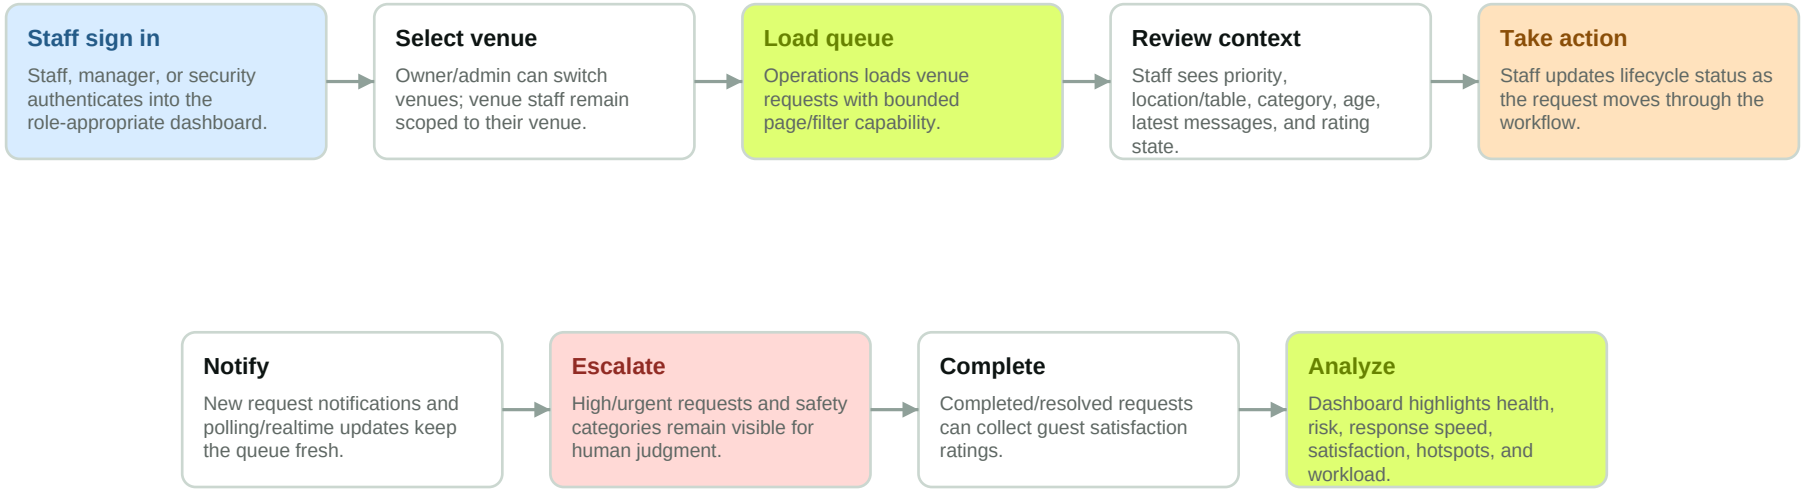


Owner/admin acceptance criteria

Can access command center only with an authorized role. Can see launch readiness without manual checklist state. Can create/manage QR points and team access. Can prove readiness by sending one end-to-end guest request into operations.

Staff Operations Flow Chart

How venue teams handle incoming guest requests.

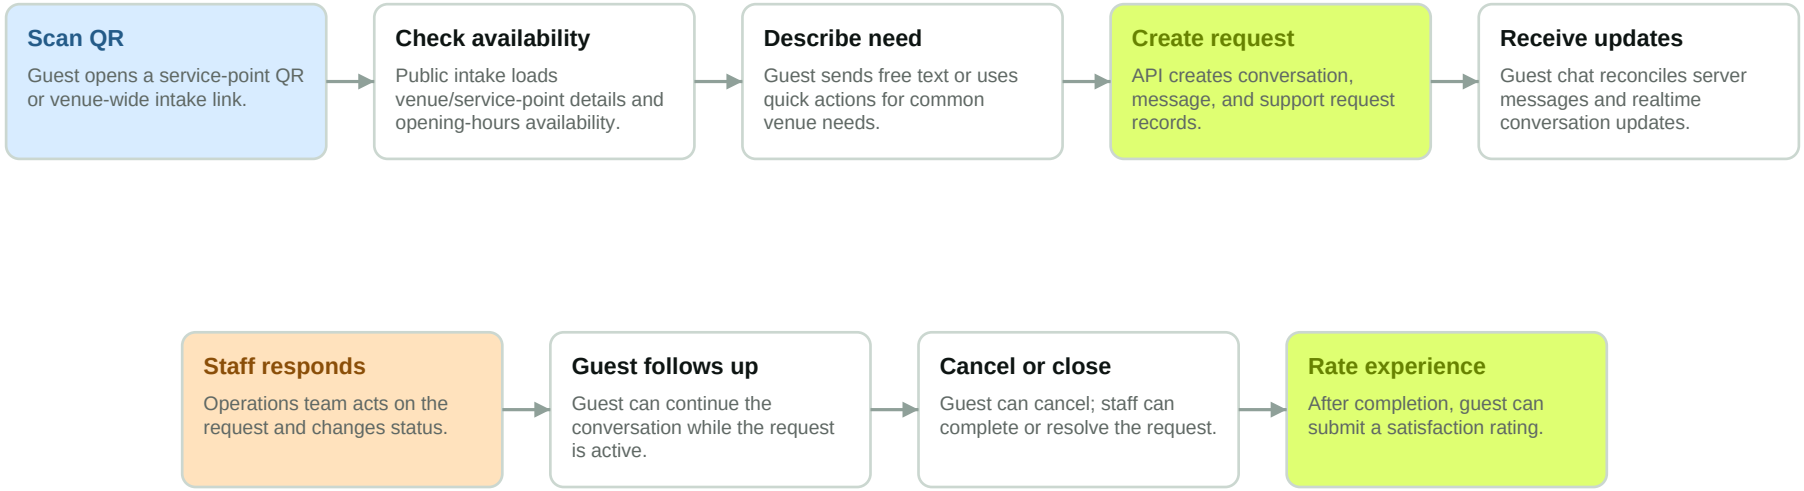


Staff acceptance criteria

Staff can quickly find active requests for their venue, understand urgency and context, update status, and see the queue remain current during a shift without loading every venue's data.

Guest Flow Chart

How a guest gets help from QR scan to follow-up.



Guest acceptance criteria

Guest can request help without an account, keeps a session for the active conversation, sees closed-venue messaging when unavailable, and can follow up or rate once staff completes the request.

Production Story Backlog

Recommended next stories after the current MVP flow.

Owner/admin

As an owner, I want guided environment/deployment checks, so I know production is safe before launch.

Manager

As a manager, I want configurable SLA rules per venue/request type, so escalation reflects how my venue operates.

Staff

As staff, I want assignment ownership and handoff notes, so multiple people do not duplicate the same work.

Guest

As a guest, I want clearer estimated response expectations, so I know whether to wait or seek urgent help.

Compliance

As an operator, I want audit exports and retention controls, so customer data handling is reviewable.

Scale

As an admin, I want workspace-level performance monitoring by venue, so growth to many venues stays visible.

How to use this document

Use pages 1-4 as the current product baseline for design, QA, and stakeholder review. Use this backlog page to decide which user outcomes should be specified next before adding more implementation work.
